Discovery starts with useful, verifiable information.

Rating Watch | GEO evidence and growth actions
https://rating.watch | 23 October 2026

The site is open to search crawlers. Its research can be easier to discover.

The public site already allows the major search crawlers and serves useful text in its initial HTML. The practical gap was narrower: its AI-readable summaries omitted two public research downloads, including the ready 100-film hub dataset.

Change delivered	Why it helps
0 to 2 dataset links in each llms output	Tools that consult the summaries can find and check the source data.
Downloads gated by their source pages	An unavailable blog hub cannot advertise a download; unpublished articles stay hidden.
22 regression tests pass	Tests cover ready, unavailable and research-only registries. Three failures reproduced the old behavior.

What this report can prove

Direct HTTP checks verified public availability, crawl rules and machine-readable summaries. Source inspection and regression tests verify the local discovery change. The report does not measure increased traffic, indexing, AI citations or installs.

No overall GEO score or platform score is presented. External authority, search-account data and real citation coverage were not available; unknown signals are not treated as failures or successes.

Priority after deployment

Verify the changed pages, inspect real index coverage in the owner's search properties, and measure organic landing visits and official-store clicks over comparable 28-day periods. Clear answers and reproducible research remain the main content opportunity.

Access is configured. Discovery still needs evidence.

Crawler rules observed live before this change was deployed.

100/100: crawler configuration checklist only.

The skill checklist awards 50 points for five first-tier agents, 25 for second-tier agents, 15 for no blanket block and 10 for accessible llms/sitemap files. This does not prove actual bot visits, ranking or citation probability.

Observed operator controls

Purpose	Agents and observed access
Search discovery	Googlebot, Bingbot, Applebot, OAI-SearchBot, Claude-SearchBot and PerplexityBot: explicitly allowed to public pages.
User-directed fetching	ChatGPT-User, Claude-User and Perplexity-User: explicitly allowed.
Training collection	GPTBot and ClaudeBot are separate training controls. Current source keeps the existing broad allow policy.
Nonpublic API paths	All groups disallow /api/. Account data remains protected by authentication; crawl rules are not access controls.

Live endpoint checks

HTTP 200: robots.txt; sitemap.xml; llms.txt; llms-full.txt; home; About; blog hub; both JSON datasets. Home and About returned server-rendered titles, H1 headings and index/follow directives. The live llms files did not link either dataset.

The requests used 30-second timeouts and at least one second between sequential fetches. Server logs and WAF rules were unavailable, so matching rules do not establish real crawler treatment.

Primary-source correction

OpenAI separates OAI-SearchBot from GPTBot. Anthropic separates Claude-SearchBot from ClaudeBot. PerplexityBot supports search. Older skill examples conflate these roles; current operator documentation controls this assessment.

Measure growth.
Do not infer it from a checklist.

Platform readiness and a concrete 30-day measurement plan.

Platform	Evidence and next check
Google AI features	Public text and crawl access exist. Google requires no special AI file or schema. Verify indexing and Web search performance in Search Console.
ChatGPT search	OAI-SearchBot access is allowed. Actual inclusion or citations are unmeasured.
Perplexity	PerplexityBot access is allowed; original data is available. Test and record actual cited URLs.
Gemini	Clear identity, research and demonstration content exist. No citation result was measured.
Bing Copilot	Verify Bing Webmaster Tools coverage and the sitemap after deployment. Notification is not indexing.

Brand search sample

Exact brand/domain, store-ID and platform-restricted searches did not identify relevant independent project mentions in the returned sample. Unrelated finance and Netflix results dominated. This signals a discovery gap in the sample, not proof of zero mentions or an index exclusion.

Next 30 days

Deploy and inspect: check the changed URLs and sitemap in the real verified properties. **Baseline:** record 28 days of queries, organic landings and store clicks. **Review:** refine titles and links using actual impressions. **Repeat:** compare matched windows and a dated sample of task-oriented AI-search prompts.

Earlier audit comparison

Earlier reports used different dates, domains, assumptions and weights. Public store installation, consistent brand identity, an author page and research now exist; many predate this session. The local change here is two dataset links per output. No comparable traffic or composite-score delta is available.

Sources and scope

Google AI features guidance | OpenAI crawlers | Anthropic crawlers | Perplexity crawlers

Companion SWARM-GEO-2026-10-23.md contains full observations, skill coverage and limitations. Prospect CRM and sales proposals were reviewed as inapplicable to this owned-site growth task. No outreach or external posts were sent.
